

Moisture Content of Fine & Coarse Aggregate

[illegible][illegible]

Formula for determining Aggregate moisture: $(A / B \times 100) - \% \text{ Absorption} = \% \text{ Moisture}$

A (weight of water) = Wet Agg in pan - Dry Aggregate in pan; B (weight of dry Agg in pan)

Note: Starting weights before drying are: 500 grams for FA, 1500 grams for CA.

Note: All Aggregate weights are exclusive of pan weight.
