

## **5.0 RECOMMENDATIONS**

Based on the results of the Phase IA background research and limited field view, further archaeological investigations are recommended for the U.S. 301 Orange Section 4 archaeological APE. Phase IB archaeological survey fieldwork is recommended for the majority of the archaeological APE in order to identify the presence or absence of significant pre-contact and/or historic period archaeological resources. The only portions of the archaeological APE where Phase I archaeological survey appears not to be needed or warranted are the previously surveyed historic resource N-5151 located in APE Segment H; immediate areas of drainage ditches or other utility disturbance; and paved/gravel areas such as roads, pull-offs, driveways, and sidewalks. Additional areas may be excepted from Phase IB archaeological survey during the actual survey fieldwork if ground conditions or informant information justify and support that decision.
