

## APPENDIX VI

### Glossary

## GLOSSARY

**Chi Square Test of Association:** a test used to determine if variables within a sample are statistically associated, that is, to determine if statistically significant differences exist which can not be attributed to chance.

**Robinson Coefficient of Agreement:** a test used to measure statistically significant similarities between two sets of values.

**Terminus Post Quem:** the beginning date of the most recent artifact in a context, provides a date before which the occupation could not have taken place.

**Z Score:** a test that allows the comparison of values from two different normal distributions and uses the score obtained to measure deviation from the population mean.
